

The Real Green Special Intra Hoof-fit Gel: The one and only

Until 2011, tetracycline, classified as an antibiotic, was the only veterinary registered and approved product to cure digital dermatitis. After a decade of research and registration efforts, Intracare proudly announced in 2011 that it had become the first company in the world to receive registration for an antibiotic-FREE product. To this day, Intra Hoof-fit Gel is still the first, but more importantly, also the only one. This proves the quality, safety and effectiveness of the concept.

The consumption of antibiotics has been greatly reduced over the years, sending a clear message for both people and livestock. The main concerns of antibiotics are:

✔ **ANTIBIOTIC RESISTANCE**

Frequent application to the claw or inhalation of antibiotic sprays by the user can lead to the development of resistant bacteria, which are more difficult to treat for both animals and humans.

✔ **LESS EFFECTIVE**

Topical antibiotics may be less effective if the infection is deep inside of the claw.

✔ **RESIDUES IN CONSUMPTION PRODUCTS**

There is a proven risk that antibiotic residues could end up in milk or meat, which could cause food safety risks and regulatory problems. A withdrawal period for milk and meat of at least 2 days should be considered, according to several scientific studies.

Intra Hoof-fit Gel is proven safe and more effective than antibiotics, has a deep penetration mechanism into the claw and has no milk withdrawal restriction. It is produced at Intracare in hospital-grade cleanrooms to GMP Pharma standards and each production batch has a controlled release by a pharmacist.
